

This key should allow you to understand why you choose the option you did (beyond just getting a question right or wrong). More instructions on how to use this key can be found [here](#).

If you have a suggestion to make the keys better, please fill out the short survey [here](#).

Note: This key is auto-generated and may contain issues and/or errors. The keys are reviewed after each exam to ensure grading is done accurately. If there are issues (like duplicate options), they are noted in the offline gradebook. The keys are a work-in-progress to give students as many resources to improve as possible.

1. For the graph below, find the value(s) a that makes the statement true: $\lim_{x \rightarrow a} f(x) = 0$.

The solution is Multiple a make the statement true., which is option D.

- A. -4
- B. 0
- C. 3
- D. Multiple a make the statement true.
- E. No a make the statement true.

General Comment: General Comments: There can be multiple a values that make the statement true! For the limit, draw a horizontal line and determine if an x value makes the limit exist.

2. Evaluate the one-sided limit of the function $f(x)$ below, if possible.

$$\lim_{x \rightarrow 2^-} \frac{-7}{(x-2)^4} + 4$$

The solution is $-\infty$, which is option C.

- A. $f(2)$
- B. ∞

- C. $-\infty$
- D. The limit does not exist
- E. None of the above

General Comment: General comments: You should be able to graph the rational function displayed. If not, go back to Module 7 to learn about the general shape of rational functions.

3. Evaluate the limit below, if possible.

$$\lim_{x \rightarrow 9} \frac{\sqrt{7x - 27} - 6}{6x - 54}$$

The solution is None of the above, which is option E.

- A. 0.441

You likely tried to use a shortcut to find the limit of a function that only works for when the numerator/denominator are polynomials.

- B. 0.014

You likely learned L'Hospital's Rule in a previous course, but misapplied it here.

- C. ∞

You likely believed that since the denominator is equal to 0, the limit is infinity.

- D. 0.083

You likely memorized how to solve the similar homework problem and used the same formula here.

- E. None of the above

* This is the correct option as the limit is 0.097.

General Comment: General comments: It is difficult to imagine the graph of this function, so you need to test values close to $x = 9$.

4. Based on the information below, which of the following statements is always true?

As x approaches 3, $f(x)$ approaches ∞ .

The solution is $f(x)$ is undefined when x is close to or exactly 3., which is option D.

- A. $f(x)$ is close to or exactly 3 when x is large enough.
- B. x is undefined when $f(x)$ is close to or exactly ∞ .
- C. $f(x)$ is close to or exactly ∞ when x is large enough.
- D. $f(x)$ is undefined when x is close to or exactly 3.
- E. None of the above are always true.

General Comment: The limit tells you what happens as the x -values approach 3. It says **absolutely nothing** about what is happening exactly at $f(3)$!

5. For the graph below, evaluate the limit: $\lim_{x \rightarrow -2} f(x)$.

The solution is 3, which is option C.

- A. $-\infty$
- B. -2
- C. 3
- D. The limit does not exist
- E. None of the above

General Comment: General Comments: Remember that the limit does not exist if the left-hand and right-hand limits do not match.

6. Evaluate the limit below, if possible.

$$\lim_{x \rightarrow 7} \frac{\sqrt{5x - 10} - 5}{3x - 21}$$

The solution is 0.167, which is option D.

- A. 0.100

You likely memorized how to solve the similar homework problem and used the same formula here.

- B. 0.745

You likely tried to use a shortcut to find the limit of a function that only works for when the numerator/denominator are polynomials.

- C. ∞

You likely believed that since the denominator is equal to 0, the limit is infinity.

- D. 0.167

* This is the correct option.

E. None of the above

If you got a limit that does not match any of the above, please contact the coordinator.

General Comment: General comments: It is difficult to imagine the graph of this function, so you need to test values close to $x = 7$.

7. Evaluate the one-sided limit of the function $f(x)$ below, if possible.

$$\lim_{x \rightarrow 3^+} \frac{-1}{(x-3)^4} + 8$$

The solution is $-\infty$, which is option A.

A. $-\infty$

B. ∞

C. $f(3)$

D. The limit does not exist

E. None of the above

General Comment: General comments: You should be able to graph the rational function displayed. If not, go back to Module 7 to learn about the general shape of rational functions.

8. To estimate the one-sided limit of the function below as x approaches 8 from the left, which of the following sets of numbers should you use?

$$\frac{\frac{8}{x} - 1}{x - 8}$$

The solution is $\{7.9000, 7.9900, 7.9990, 7.9999\}$, which is option E.

A. $\{8.0000, 8.1000, 8.0100, 8.0010\}$

If we get $\frac{0}{0}$ or $\frac{\infty}{\infty}$, the value 8 doesn't help us estimate the limit.

B. $\{7.9000, 7.9900, 8.0100, 8.1000\}$

These values would estimate the limit at the point and not a one-sided limit.

C. $\{8.0000, 7.9000, 7.9900, 7.9990\}$

If we get $\frac{0}{0}$ or $\frac{\infty}{\infty}$, the value 8 doesn't help us estimate the limit.

D. $\{8.1000, 8.0100, 8.0010, 8.0001\}$

These values would estimate the limit of 8 on the right.

E. $\{7.9000, 7.9900, 7.9990, 7.9999\}$

This is correct!

General Comment: General Comments: To evaluate a one-sided limit, we want to put numbers close to the limit. We can't use the limit value itself if it results in $\frac{0}{0}$ or $\frac{\infty}{\infty}$

9. To estimate the one-sided limit of the function below as x approaches 9 from the left, which of the following sets of numbers should you use?

$$\frac{\frac{9}{x} - 1}{x - 9}$$

The solution is $\{8.9000, 8.9900, 8.9990, 8.9999\}$, which is option B.

- A. $\{9.0000, 8.9000, 8.9900, 8.9990\}$

If we get $\frac{0}{0}$ or $\frac{\infty}{\infty}$, the value 9 doesn't help us estimate the limit.

- B. $\{8.9000, 8.9900, 8.9990, 8.9999\}$

This is correct!

- C. $\{9.1000, 9.0100, 9.0010, 9.0001\}$

These values would estimate the limit of 9 on the right.

- D. $\{8.9000, 8.9900, 9.0100, 9.1000\}$

These values would estimate the limit at the point and not a one-sided limit.

- E. $\{9.0000, 9.1000, 9.0100, 9.0010\}$

If we get $\frac{0}{0}$ or $\frac{\infty}{\infty}$, the value 9 doesn't help us estimate the limit.

General Comment: General Comments: To evaluate a one-sided limit, we want to put numbers close to the limit. We can't use the limit value itself if it results in $\frac{0}{0}$ or $\frac{\infty}{\infty}$

10. Based on the information below, which of the following statements is always true?

As x approaches 8, $f(x)$ approaches 12.177.

The solution is None of the above are always true., which is option E.

- A. $f(8)$ is close to or exactly 12

- B. $f(8) = 12$

- C. $f(12)$ is close to or exactly 8

- D. $f(12) = 8$

- E. None of the above are always true.

General Comment: The limit tells you what happens as the x -values approach 8. It says **absolutely nothing** about what is happening exactly at $f(8)$!
