

This key should allow you to understand why you choose the option you did (beyond just getting a question right or wrong). More instructions on how to use this key can be found [here](#).

If you have a suggestion to make the keys better, please fill out the short survey [here](#).

Note: This key is auto-generated and may contain issues and/or errors. The keys are reviewed after each exam to ensure grading is done accurately. If there are issues (like duplicate options), they are noted in the offline gradebook. The keys are a work-in-progress to give students as many resources to improve as possible.

1. Using an interval or intervals, describe all the x -values within or including a distance of the given values.

No more than 3 units from the number -10 .

The solution is $[-13, -7]$, which is option A.

A. $[-13, -7]$

This describes the values no more than 3 from -10

B. $(-13, -7)$

This describes the values less than 3 from -10

C. $(-\infty, -13] \cup [-7, \infty)$

This describes the values no less than 3 from -10

D. $(-\infty, -13) \cup (-7, \infty)$

This describes the values more than 3 from -10

E. None of the above

You likely thought the values in the interval were not correct.

General Comment: When thinking about this language, it helps to draw a number line and try points.

2. Using an interval or intervals, describe all the x -values within or including a distance of the given values.

Less than 6 units from the number -6 .

The solution is $(-12, 0)$, which is option D.

A. $[-12, 0]$

This describes the values no more than 6 from -6

B. $(-\infty, -12) \cup (0, \infty)$

This describes the values more than 6 from -6

C. $(-\infty, -12] \cup [0, \infty)$

This describes the values no less than 6 from -6

D. $(-12, 0)$

This describes the values less than 6 from -6

E. None of the above

You likely thought the values in the interval were not correct.

General Comment: When thinking about this language, it helps to draw a number line and try points.

3. Solve the linear inequality below. Then, choose the constant and interval combination that describes the solution set.

$$-7 - 5x \leq \frac{-36x - 4}{8} < 4 - 7x$$

The solution is $[-13.00, 1.80)$, which is option B.

- A. $(a, b]$, where $a \in [-14.25, -9]$ and $b \in [-1.5, 4.5]$

$(-13.00, 1.80]$, which corresponds to flipping the inequality.

- B. $[a, b)$, where $a \in [-14.25, -12]$ and $b \in [0, 4.5]$

$[-13.00, 1.80)$, which is the correct option.

- C. $(-\infty, a) \cup [b, \infty)$, where $a \in [-14.25, -7.5]$ and $b \in [0.75, 3]$

$(-\infty, -13.00) \cup [1.80, \infty)$, which corresponds to displaying the and-inequality as an or-inequality AND flipping the inequality.

- D. $(-\infty, a] \cup (b, \infty)$, where $a \in [-13.5, -10.5]$ and $b \in [0.75, 4.5]$

$(-\infty, -13.00] \cup (1.80, \infty)$, which corresponds to displaying the and-inequality as an or-inequality.

- E. None of the above.

General Comment: To solve, you will need to break up the compound inequality into two inequalities. Be sure to keep track of the inequality! It may be best to draw a number line and graph your solution.

4. Solve the linear inequality below. Then, choose the constant and interval combination that describes the solution set.

$$-6 + 9x \leq \frac{84x + 5}{9} < 9 + 3x$$

The solution is None of the above., which is option E.

- A. $(-\infty, a) \cup [b, \infty)$, where $a \in [18, 20.25]$ and $b \in [-1.57, -0.15]$

$(-\infty, 19.67) \cup [-1.33, \infty)$, which corresponds to displaying the and-inequality as an or-inequality AND flipping the inequality AND getting negatives of the actual endpoints.

- B. $[a, b)$, where $a \in [18, 23.25]$ and $b \in [-6, 0]$

$[19.67, -1.33)$, which is the correct interval but negatives of the actual endpoints.

- C. $(-\infty, a] \cup (b, \infty)$, where $a \in [17.25, 23.25]$ and $b \in [-2.62, -0.67]$

$(-\infty, 19.67] \cup (-1.33, \infty)$, which corresponds to displaying the and-inequality as an or-inequality and getting negatives of the actual endpoints.

- D. $(a, b]$, where $a \in [18.75, 24]$ and $b \in [-1.8, -0.15]$

$(19.67, -1.33]$, which corresponds to flipping the inequality and getting negatives of the actual endpoints.

- E. None of the above.

* This is correct as the answer should be $[-19.67, 1.33)$.

General Comment: To solve, you will need to break up the compound inequality into two inequalities. Be sure to keep track of the inequality! It may be best to draw a number line and graph your solution.

5. Solve the linear inequality below. Then, choose the constant and interval combination that describes the solution set.

$$-8 + 6x > 9x \text{ or } -3 + 6x < 9x$$

The solution is $(-\infty, -2.667)$ or $(-1.0, \infty)$, which is option C.

- A. $(-\infty, a) \cup (b, \infty)$, where $a \in [0.75, 5.25]$ and $b \in [0, 5.25]$

Corresponds to inverting the inequality and negating the solution.

- B. $(-\infty, a] \cup [b, \infty)$, where $a \in [-6.75, -0.75]$ and $b \in [-3.75, 1.5]$

Corresponds to including the endpoints (when they should be excluded).

- C. $(-\infty, a) \cup (b, \infty)$, where $a \in [-5.25, 0.75]$ and $b \in [-1.5, 1.5]$

* Correct option.

- D. $(-\infty, a] \cup [b, \infty)$, where $a \in [0, 3]$ and $b \in [1.5, 6]$

Corresponds to including the endpoints AND negating.

- E. $(-\infty, \infty)$

Corresponds to the variable canceling, which does not happen in this instance.

General Comment: When multiplying or dividing by a negative, flip the sign.

6. Solve the linear inequality below. Then, choose the constant and interval combination that describes the solution set.

$$\frac{-9}{2} - \frac{10}{4}x \leq \frac{4}{6}x - \frac{7}{9}$$

The solution is $[-1.175, \infty)$, which is option B.

- A. $[a, \infty)$, where $a \in [0.75, 1.5]$

$[1.175, \infty)$, which corresponds to negating the endpoint of the solution.

- B. $[a, \infty)$, where $a \in [-2.25, 0.75]$

* $[-1.175, \infty)$, which is the correct option.

- C. $(-\infty, a]$, where $a \in [0, 6]$

$(-\infty, 1.175]$, which corresponds to switching the direction of the interval AND negating the endpoint. You likely did this if you did not flip the inequality when dividing by a negative as well as not moving values over to a side properly.

- D. $(-\infty, a]$, where $a \in [-2.25, 0]$

$(-\infty, -1.175]$, which corresponds to switching the direction of the interval. You likely did this if you did not flip the inequality when dividing by a negative!

- E. None of the above.

You may have chosen this if you thought the inequality did not match the ends of the intervals.

General Comment: Remember that less/greater than or equal to includes the endpoint, while less/greater do not. Also, remember that you need to flip the inequality when you multiply or divide by a negative.

7. Solve the linear inequality below. Then, choose the constant and interval combination that describes the solution set.

$$9 + 3x > 6x \text{ or } 6 + 9x < 10x$$

The solution is $(-\infty, 3.0)$ or $(6.0, \infty)$, which is option B.

- A. $(-\infty, a) \cup (b, \infty)$, where $a \in [-11.25, -1.5]$ and $b \in [-7.5, 2.25]$

Corresponds to inverting the inequality and negating the solution.

- B. $(-\infty, a) \cup (b, \infty)$, where $a \in [-5.25, 4.5]$ and $b \in [5.25, 6.75]$

* Correct option.

- C. $(-\infty, a] \cup [b, \infty)$, where $a \in [-11.25, -3.75]$ and $b \in [-7.5, 1.5]$

Corresponds to including the endpoints AND negating.

- D. $(-\infty, a] \cup [b, \infty)$, where $a \in [0.75, 6]$ and $b \in [2.25, 7.5]$

Corresponds to including the endpoints (when they should be excluded).

- E. $(-\infty, \infty)$

Corresponds to the variable canceling, which does not happen in this instance.

General Comment: When multiplying or dividing by a negative, flip the sign.

8. Solve the linear inequality below. Then, choose the constant and interval combination that describes the solution set.

$$-4x - 6 \geq 6x + 5$$

The solution is $(-\infty, -1.1]$, which is option B.

- A. $[a, \infty)$, where $a \in [-0.2, 4]$

$[1.1, \infty)$, which corresponds to switching the direction of the interval AND negating the endpoint. You likely did this if you did not flip the inequality when dividing by a negative as well as not moving values over to a side properly.

- B. $(-\infty, a]$, where $a \in [-6.1, 0.9]$

* $(-\infty, -1.1]$, which is the correct option.

- C. $[a, \infty)$, where $a \in [-2.1, 1]$

$[-1.1, \infty)$, which corresponds to switching the direction of the interval. You likely did this if you did not flip the inequality when dividing by a negative!

- D. $(-\infty, a]$, where $a \in [-0.9, 3.1]$

$(-\infty, 1.1]$, which corresponds to negating the endpoint of the solution.

- E. None of the above.

You may have chosen this if you thought the inequality did not match the ends of the intervals.

General Comment: Remember that less/greater than or equal to includes the endpoint, while less/greater do not. Also, remember that you need to flip the inequality when you multiply or divide by a negative.

9. Solve the linear inequality below. Then, choose the constant and interval combination that describes the solution set.

$$-9x + 5 \leq 3x + 8$$

The solution is $[-0.25, \infty)$, which is option A.

- A. $[a, \infty)$, where $a \in [-0.63, 0]$

* $[-0.25, \infty)$, which is the correct option.

- B. $(-\infty, a]$, where $a \in [-1.19, 0]$

$(-\infty, -0.25]$, which corresponds to switching the direction of the interval. You likely did this if you did not flip the inequality when dividing by a negative!

- C. $(-\infty, a]$, where $a \in [0, 0.27]$

$(-\infty, 0.25]$, which corresponds to switching the direction of the interval AND negating the endpoint. You likely did this if you did not flip the inequality when dividing by a negative as well as not moving values over to a side properly.

- D. $[a, \infty)$, where $a \in [-0.18, 0.5]$

$[0.25, \infty)$, which corresponds to negating the endpoint of the solution.

- E. None of the above.

You may have chosen this if you thought the inequality did not match the ends of the intervals.

General Comment: Remember that less/greater than or equal to includes the endpoint, while less/greater do not. Also, remember that you need to flip the inequality when you multiply or divide by a negative.

10. Solve the linear inequality below. Then, choose the constant and interval combination that describes the solution set.

$$\frac{-7}{9} - \frac{4}{6}x < \frac{6}{5}x + \frac{10}{2}$$

The solution is $(-3.095, \infty)$, which is option A.

- A. (a, ∞) , where $a \in [-9, 0]$

* $(-3.095, \infty)$, which is the correct option.

- B. $(-\infty, a)$, where $a \in [-3.75, 0.75]$

$(-\infty, -3.095)$, which corresponds to switching the direction of the interval. You likely did this if you did not flip the inequality when dividing by a negative!

- C. $(-\infty, a)$, where $a \in [1.5, 6]$

$(-\infty, 3.095)$, which corresponds to switching the direction of the interval AND negating the endpoint. You likely did this if you did not flip the inequality when dividing by a negative as well as not moving values over to a side properly.

- D. (a, ∞) , where $a \in [3, 5.25]$

$(3.095, \infty)$, which corresponds to negating the endpoint of the solution.

- E. None of the above.

You may have chosen this if you thought the inequality did not match the ends of the intervals.

Answer Key for Makeup Progress Quiz 2 Version A

General Comment: Remember that less/greater than or equal to includes the endpoint, while less/greater do not. Also, remember that you need to flip the inequality when you multiply or divide by a negative.
