

This key should allow you to understand why you choose the option you did (beyond just getting a question right or wrong). More instructions on how to use this key can be found [here](#).

If you have a suggestion to make the keys better, please fill out the short survey [here](#).

Note: This key is auto-generated and may contain issues and/or errors. The keys are reviewed after each exam to ensure grading is done accurately. If there are issues (like duplicate options), they are noted in the offline gradebook. The keys are a work-in-progress to give students as many resources to improve as possible.

1. For the graph below, find the value(s) a that makes the statement true: $\lim_{x \rightarrow a} f(x)$ does not exist.

The solution is 1, which is option A.

- A. 1
- B. -2
- C. 3
- D. Multiple a make the statement true.
- E. No a make the statement true.

General Comment: General Comments: Remember that the limit does not exist if the left-hand and right-hand limits do not match.

2. Evaluate the one-sided limit of the function $f(x)$ below, if possible.

$$\lim_{x \rightarrow -1^+} \frac{8}{(x-1)^7} + 5$$

The solution is $f(-1)$, which is option C.

- A. $-\infty$
- B. ∞

- C. $f(-1)$
- D. The limit does not exist
- E. None of the above

General Comment: General comments: You should be able to graph the rational function displayed. If not, go back to Module 7 to learn about the general shape of rational functions.

3. Evaluate the limit below, if possible.

$$\lim_{x \rightarrow 8} \frac{\sqrt{9x - 36} - 6}{2x - 16}$$

The solution is None of the above, which is option E.

- A. 0.083

You likely memorized how to solve the similar homework problem and used the same formula here.

- B. 1.500

You likely tried to use a shortcut to find the limit of a function that only works for when the numerator/denominator are polynomials.

- C. ∞

You likely believed that since the denominator is equal to 0, the limit is infinity.

- D. 0.042

You likely learned L'Hospital's Rule in a previous course, but misapplied it here.

- E. None of the above

* This is the correct option as the limit is 0.375.

General Comment: General comments: It is difficult to imagine the graph of this function, so you need to test values close to $x = 8$.

4. Based on the information below, which of the following statements is always true?

As x approaches 2, $f(x)$ approaches 0.774.

The solution is $f(x)$ is close to or exactly 0.774 when x is close to 2, which is option A.

- A. $f(x)$ is close to or exactly 0.774 when x is close to 2
- B. $f(x) = 2$ when x is close to 0.774
- C. $f(x) = 0.774$ when x is close to 2
- D. $f(x)$ is close to or exactly 2 when x is close to 0.774
- E. None of the above are always true.

General Comment: The limit tells you what happens as the x -values approach 2. It says **absolutely nothing** about what is happening exactly at $f(2)$!

5. For the graph below, find the value(s) a that makes the statement true: $\lim_{x \rightarrow a} f(x) = 3$.

The solution is Multiple a make the statement true., which is option D.

- A. $-\infty$
- B. -2
- C. 1
- D. Multiple a make the statement true.
- E. No a make the statement true.

General Comment: General Comments: There can be multiple a values that make the statement true! For the limit, draw a horizontal line and determine if an x value makes the limit exist.

6. Evaluate the limit below, if possible.

$$\lim_{x \rightarrow 7} \frac{\sqrt{6x-6} - 6}{9x - 63}$$

The solution is 0.056, which is option C.

- A. ∞

You likely believed that since the denominator is equal to 0, the limit is infinity.

- B. 0.083

You likely memorized how to solve the similar homework problem and used the same formula here.

- C. 0.056

* This is the correct option.

- D. 0.272

You likely tried to use a shortcut to find the limit of a function that only works for when the numerator/denominator are polynomials.

E. None of the above

If you got a limit that does not match any of the above, please contact the coordinator.

General Comment: General comments: It is difficult to imagine the graph of this function, so you need to test values close to $x = 7$.

7. Evaluate the one-sided limit of the function $f(x)$ below, if possible.

$$\lim_{x \rightarrow 3^+} \frac{-6}{(x+3)^3} + 3$$

The solution is $f(3)$, which is option C.

A. ∞

B. $-\infty$

C. $f(3)$

D. The limit does not exist

E. None of the above

General Comment: General comments: You should be able to graph the rational function displayed. If not, go back to Module 7 to learn about the general shape of rational functions.

8. To estimate the one-sided limit of the function below as x approaches 6 from the left, which of the following sets of numbers should you use?

$$\frac{\frac{6}{x} - 1}{x - 6}$$

The solution is $\{5.9000, 5.9900, 5.9990, 5.9999\}$, which is option D.

A. $\{6.0000, 5.9000, 5.9900, 5.9990\}$

If we get $\frac{0}{0}$ or $\frac{\infty}{\infty}$, the value 6 doesn't help us estimate the limit.

B. $\{5.9000, 5.9900, 6.0100, 6.1000\}$

These values would estimate the limit at the point and not a one-sided limit.

C. $\{6.1000, 6.0100, 6.0010, 6.0001\}$

These values would estimate the limit of 6 on the right.

D. $\{5.9000, 5.9900, 5.9990, 5.9999\}$

This is correct!

E. $\{6.0000, 6.1000, 6.0100, 6.0010\}$

If we get $\frac{0}{0}$ or $\frac{\infty}{\infty}$, the value 6 doesn't help us estimate the limit.

General Comment: General Comments: To evaluate a one-sided limit, we want to put numbers close to the limit. We can't use the limit value itself if it results in $\frac{0}{0}$ or $\frac{\infty}{\infty}$

9. To estimate the one-sided limit of the function below as x approaches 7 from the left, which of the following sets of numbers should you use?

$$\frac{\frac{7}{x} - 1}{x - 7}$$

The solution is $\{6.9000, 6.9900, 6.9990, 6.9999\}$, which is option C.

- A. $\{6.9000, 6.9900, 7.0100, 7.1000\}$

These values would estimate the limit at the point and not a one-sided limit.

- B. $\{7.0000, 6.9000, 6.9900, 6.9990\}$

If we get $\frac{0}{0}$ or $\frac{\infty}{\infty}$, the value 7 doesn't help us estimate the limit.

- C. $\{6.9000, 6.9900, 6.9990, 6.9999\}$

This is correct!

- D. $\{7.0000, 7.1000, 7.0100, 7.0010\}$

If we get $\frac{0}{0}$ or $\frac{\infty}{\infty}$, the value 7 doesn't help us estimate the limit.

- E. $\{7.1000, 7.0100, 7.0010, 7.0001\}$

These values would estimate the limit of 7 on the right.

General Comment: General Comments: To evaluate a one-sided limit, we want to put numbers close to the limit. We can't use the limit value itself if it results in $\frac{0}{0}$ or $\frac{\infty}{\infty}$

10. Based on the information below, which of the following statements is always true?

As x approaches 4, $f(x)$ approaches 1.61.

The solution is None of the above are always true., which is option E.

- A. $f(1) = 4$

- B. $f(4)$ is close to or exactly 1

- C. $f(4) = 1$

- D. $f(1)$ is close to or exactly 4

- E. None of the above are always true.

General Comment: The limit tells you what happens as the x -values approach 4. It says **absolutely nothing** about what is happening exactly at $f(4)$!
